 AB In most patients with systemic mastocytosis (SM), including aggressive SM and mast cell leukemia (MCL), neoplastic cells express the oncogenic KIT mutation D816V. KIT D816V is associated with constitutive tyrosine kinase (TK) activity and thus represents an attractive drug target. However, imatinib and most other TK inhibitors fail to block the TK activity of KIT D816V. We show that the novel TK-targeting drugs PKC412 and AMN107 counteract TK activity of D816V KIT and inhibit the growth of Ba/F3 cells with doxycycline-inducible expression of KIT D816V as well as the growth of primary neoplastic mast cells and HMC-1 cells harboring this KIT mutation. PKC412 was a superior agent with median inhibitory concentration (IC50) values of 50 to 250 nM without differences seen between HMC-1 cells exhibiting or lacking KIT D816V. By contrast, AMN107 exhibited more potent effects in KIT D816V- HMC-1 cells. Corresponding results were obtained with Ba/F3 cells exhibiting wild-type or D816V-mutated KIT. The growth-inhibitory effects of PKC412 and AMN107 on HMC-1 cells were associated with induction of apoptosis and down-regulation of CD2 and CD63. PKC412 was found to cooperate with AMN107, imatinib, and cladribine (2CdA) in producing growth inhibition in HMC-1, but synergistic drug interactions were observed only in cells lacking KIT D816V. Together, PKC412 and AMN107 represent promising novel agents for targeted therapy of SM.

 AB A review with refs. Targeted cancer therapy with imatinib (Gleevec) has
 the capability to drive chronic myeloid leukemia (CML) into clin.
 remission. Some patients, particularly those with advanced disease,
 develop resistance to imatinib. To counteract this problem, two new
 BCR-ABL kinase inhibitors for imatinib-refractory disease are currently in
 clin. trials: the imatinib derivative AMN107 and the dual-specificity SRC/ABL
 inhibitor dasatinib. Using imatinib to reduce leukemic burden also
 facilitates the detailed investigation into how the persistence of CML
 disease depends on BCR-ABL signaling, particularly within the leukemic
 stem cell compartment. Math. models of drug resistance and disease
 relapse, in addition to exptl. systems that recapitulate crucial aspects of
 advanced disease have deepened our understanding of CML biol. Together,
 these advances are contributing to a high level of disease control, and
 might ultimately lead to disease eradication.

AB The invention provides compds. and methods for inhibiting histone deacetylase enzymic activity. Such compds. include carboxamides I [Cy2 = (un)substituted cycloalkyl, aryl, heteroaryl, heterocyclyl (each of which is optionally fused to one or two aryl or heteroaryl rings, or to one or two (un)saturated cycloalkyl or heterocyclic rings); X1 = a bond, M1L2M1, L2M2L2 (wherein L2 = a bond, alkylene, alkenylene, alkynylene; M1 = O, S, SO, NHCO, etc.; M2 = M1, heteroarylene, heterocyclylene); Ar2 = (un)substituted (hetero)arylene; R5, R6 = H, alkyl, aryl, aralkyl; q = 0-1; Ay2 = (un)substituted 5-6 membered cycloalkyl, heterocyclyl or heteroaryl substituted with an amino or hydroxy moiety; with provisos] which were prepared and claimed. E.g., a multi-step synthesis of II, starting from Me 4-(aminomethyl)benzoate.HCl, was given. The invention also provides compns. and methods for treating cell proliferative diseases and conditions. Antineoplastic effects of some I are illustrated for colorectal, pulmonary and pancreatic neoplasms; also the combined antineoplastic effect of histone deacetylase inhibitors and histone deacetylase antisense oligonucleotides on tumor cells in vivo was demonstrated. Although the methods of preparation are not claimed, hundreds of example preps. are included.

AB A review. The constitutively activated Abl tyrosine kinase domain of the chimeric Bcr-Abl oncoprotein is responsible for the transformation of hematopoietic stem cells and the symptoms of chronic myeloid leukemia (CML). Imatinib targets the tyrosine kinase activity of Bcr-Abl and is a first-line therapy for this malignancy. Although highly effective in chronic phase CML, patients who have progressed to the advanced phase of the disease frequently fail to respond to imatinib or develop resistance to therapy and relapse. This is often due to the emergence of clones expressing mutant forms of Bcr-Abl, which exhibit a decreased sensitivity towards inhibition by imatinib. Considerable progress has recently been made in understanding the structural biol. of Abl and the mol. basis for resistance, facilitating the discovery and development of second generation drugs designed to combat mutant forms of Bcr-Abl. The first of these compds. to enter clin. development were BMS-354825 (BristolMyersSquibb) and AMN107 (Novartis Pharma) and, from Phase I results, both of these promise a breakthrough in the treatment of imatinib-resistant CML. Recent advances with these and other promising classes of new CML drugs are reviewed.

AB The invention relates to thiazole compds. of formula I, which are modulators of peroxisome proliferator-activated receptors (PPAR), particularly PPAR δ . In compds. I, p is 0-3; L is selected from -XOX-, -XS(O)mX-, and -XS(O)mXO-, where m is 0-2 and X is a bond or (un)substituted C1-4 alkylene; R1 is selected from halo, C1-6 alkyl, C1-6 alkoxy, C1-6 hydroxyalkyl, C1-6 haloalkyl, C1-6 haloalkoxy, (un)substituted C6-10 aryl, (un)substituted C5-10 heteroaryl, (un)substituted C3-12 cycloalkyl, and (un)substituted C3-8 heterocyclyl; R2 is -XOXC(O)R5 or -XCO2R5, where X is as defined previously and R5 is H or C1-6 alkyl; and R3 and R4 are independently selected from R6 and R6Y, where R6 is (un)substituted C3-12 cycloalkyl, (un)substituted C3-8 heterocyclyl, (un)substituted C6-10 aryl, and (un)substituted C5-13 heteroaryl, and Y is selected from C1-6 alkylene, C2-6 alkenylene, C2-6 alkynylene, -C(O)N(R5)-, and -OX-, where X and R5 are as defined previously, or R3 and R4, together with the atoms to which they are attached, form fused bi- or tricyclic C5-14 heteroaryl; including pharmaceutically acceptable salts, hydrates, solvates, isomers, and prodrugs thereof. The invention also relates to the preparation of I, pharmaceutical compns. comprising a therapeutically effective amount of compound I in combination with one or more pharmaceutically acceptable excipients, as well as to the use of the compns. to treat or prevent diseases or disorders associated with PPAR activity. Cyclocondensation of 2-bromo-4'-methoxyacetophenone with thioacetamide followed by bromination, demethylation, and alkylation with iso-Pr iodide gave bromothiazole II, which was brominated and substituted with phenol III (preparation in 3 steps from 4-hydroxy-3-methylacetophenone given) to give thiazole IV. Compound IV underwent Suzuki coupling with 4-(trifluoromethoxy)phenylboronic acid and

ester hydrolysis to give thiazole V. Most preferred compds. of the invention express an EC50 value for PPAR δ of less than 100 nM. The compds. of the invention are at least 100-fold selective for PPAR δ over PPAR γ .

AB The invention relates to aryl compds. of formula I, which are modulators of peroxisome proliferator-activated receptors (PPAR), particularly PPAR δ . In compds. I, m is 0-3; X, Y, and Z are independently selected from CH and N; L is (un)substituted (CH₂)_nO(CH₂)_n or (CH₂)_nS(O)_p(CH₂)_n, where each n is independently selected from 0-4 and p is 0-2; R₁ and R₂ are independently selected from (un)substituted C₃-12 cycloalkyl-A-, (un)substituted C₃-8 heterocyclyl-A-, (un)substituted C₆-10 aryl-A-, and (un)substituted C₅-13 heteroaryl-A-, where A is a bond, C₁-6 alkylene, C₂-6 alkenylene, or C₂-6 alkynylene; R₃ is selected from halo, C₁-6 alkyl, C₁-6 alkoxy, C₁-6 hydroxyalkyl, C₁-6 haloalkyl, C₁-6 haloalkoxy, (un)substituted C₆-10 aryl, (un)substituted C₅-10 heteroaryl, (un)substituted C₃-12 cycloalkyl, and (un)substituted C₃-8 heterocyclyl; and R₄ is selected from (CH₂)_nO(CH₂)_nCO₂R₅ and (CH₂)_nCO₂R₅, where n is as defined previously and R₅ is H or C₁-6 alkyl; including pharmaceutically acceptable salts, hydrates, solvates, isomers, and prodrugs thereof. The invention also relates to the preparation of I, pharmaceutical compns. comprising a therapeutically effective amount of compound I in combination with one or more pharmaceutically acceptable excipients, as well as to the use of the compns. to treat or prevent diseases or disorders associated with PPAR activity. Substitution of Me bromoacetate with 4-hydroxy-3-methylacetophenone followed by Baeyer-Villiger oxidation and methanolysis gave phenoxyacetate II, which underwent substitution of 3,5-dibromobenzyl bromide to give dibromobenzyl ether III. Treatment of III with an excess of 4-trifluoromethylphenylboronic acid and ester hydrolysis resulted in the formation of terphenyl IV. Most preferred compds. of the invention express an EC₅₀ value for PPAR δ of less than 100 nM. The compds. of the invention are at least 100-fold selective for PPAR δ over PPAR γ .

 AB AMN107 is a small mol. tyrosine kinase inhibitor developed, in the first
 instance, as a potent inhibitor of breakpoint cluster region-abelson
 (BCR-ABL). The authors tested its effectiveness against fusion tyrosine
 kinases TEL-platelet-derived growth factor receptor β
 (TEL-PDGFR β) and FIP1-like-1 (FIP1L1)-PDGFR α , which cause
 chronic myelomonocytic leukemia and hypereosinophilic syndrome, resp. In
 vitro, AMN107 inhibited proliferation of Ba/F3 cells transformed by both
 TEL-PDGFR β and FIP1L1-PDGFR α with IC₅₀ (inhibitory concentration 50%)
 values less than 25 nM and inhibited phosphorylation of the fusion kinases
 and their downstream signaling targets. The imatinib mesylate-resistant
 mutant TEL-PDGFR β T681I was sensitive to AMN107, whereas the
 analogous mutation in FIP1L1-PDGFR α , T674I, was resistant. In an in
 vivo bone marrow transplantation assay, AMN107 effectively treated
 myeloproliferative disease induced by TEL-PDGFR β and
 FIP1L1-PDGFR α , significantly increasing survival and disease latency
 and reducing disease severity as assessed by histopathol. and flow
 cytometry. In summary, AMN107 can inhibit myeloid proliferation driven by
 TEL-PDGFR β and FIP1L1-PDGFR α and may be a useful drug for
 treatment of patients with myeloproliferative disease who harbor these
 kinase fusions.

AB Chronic myeloid leukemia (CML) is a myeloproliferative disease in which BCR/ABL enhances survival of leukemic cells through modulation of proapoptotic and antiapoptotic mols. Recent data suggest that proapoptotic Bcl-2-interacting mediator (Bim) plays a role as a tumor suppressor in myeloid cells, and that leukemic cells express only low amts. of this cell death activator. We here show that primary CML cells express significantly lower amts. of bim mRNA and Bim protein compared with normal cells. The BCR/ABL inhibitors imatinib and AMN107 were found to promote expression of Bim in CML cells. To provide direct evidence for the role of BCR/ABL in Bim modulation, we employed Ba/F3 cells with doxycycline-inducible expression of BCR/ABL and found that BCR/ABL decreases expression of bim mRNA and Bim protein in these cells. The BCR/ABL-induced decrease in expression of Bim was found to be a posttranscriptional event that depended on signaling through the mitogen-activated protein kinase pathway and was abrogated by the proteasome inhibitor MG132. Interestingly, MG132 up-regulated the expression of bim mRNA and Bim protein and suppressed the growth of Ba/F3 cells containing wild-type BCR/ABL or imatinib-resistant mutants of BCR/ABL. To show functional significance of "Bim reexpression", a Bim-specific small interfering RNA was applied and found to rescue BCR/ABL-transformed leukemic cells from imatinib-induced cell death. In summary, our data identify BCR/ABL as a Bim suppressor in CML cells and suggest that reexpression of Bim by novel tyrosine kinase inhibitors, proteasome inhibition, or by targeting signaling pathways downstream of BCR/ABL may be an attractive therapeutic approach in imatinib-resistant CML.

AB Background: Previous studies have shown that patients with Bcr-Abl-pos. acute lymphoblastic leukemia (ALL) either have primary disease that is refractory to imatinib mesylate or develop disease recurrence after an initial response. Methods: The authors investigated the effects of a newly designed Bcr-Abl inhibitor, AMN107, by comparing its in vitro inhibitory potency on p190 Bcr-Abl ALL cell lines with that of imatinib. Results: In two Philadelphia (Ph)-pos. ALL cell lines, AMN107 was found to be 30-40 times more potent than imatinib in inhibiting cellular proliferation. AMN107 was also more effective than imatinib in inhibiting phosphorylation of p190 Bcr-Abl tyrosine kinase in cell lines and primary ALL cells. The inhibition of cellular proliferation was associated with the induction of apoptosis in only one of the cell lines. No activity was observed in cell lines lacking the BCR-ABL genotype. Conclusions: The results of the current study suggest the superior potency of AMN107 compared with imatinib in Ph-pos. ALL and support clin. trials of AMN107 in patients with Ph-pos. ALL.

 DT Journal; General Review
 LA English
 AB A review. The Philadelphia (Ph) chromosome was the first consistent chromosome abnormality identified in cancer. It is found in 90% of patients with chronic myeloid leukemia (CML) and in a subset of patients with acute lymphoblastic leukemia. The effectiveness of the Bcr-Abl kinase inhibitor imatinib in these conditions reduces with advancing disease and/or the development of resistance to imatinib. AMN-107 inhibited the proliferation of hematopoietic cells expressing the mutants in Ph+ CML and acute lymphoblastic leukemia with concns. causing 50% inhibition of .apprx. 12 nM, making it more potent than imatinib. AMN-107 was also effective against several imatinib-resistant Bcr-Abl mutants, but not T3151. In mice transduced with Bcr-Abl, AMN-107 reduced mortality and tumor burden. In mice transduced with the E255V imatinib-resistant mutant of Bcr-Abl, AMN-107 delayed the onset of leukemia. As AMN-107 is more potent and more selective for Bcr-Abl than imatinib, it may represent a step forward in the treatment of CML, but further animal (and then clin.) studies are needed to test this.

 AB Resistance to or intolerance of imatinib in patients with Philadelphia chromosome-pos. chronic myelogenous leukemia (CML) has encouraged the development of more potent Bcr-Abl inhibitors. AMN107 is a novel, orally bioavailable ATP-competitive inhibitor of Bcr-Abl. The effects of AMN107 were compared with those of imatinib on imatinib-sensitive (KBM5 and KBM7) and imatinib-resistant CML cell lines (KBM5-STI571R1.0 and KBM7-STI571R1.0). Compared with the antiproliferative activity of imatinib, AMN107 was 43 times more potent in KBM5 (IC50 of 11.3 vs. 480.5 nmol/L) and 60 times more potent in KBM7 (IC50 of 4.3 vs. 259.0 nmol/L) cells. IC50 for AMN107 and imatinib were 2,418.3 and 6,361.4 nmol/L, resp., in KBM5-STI571R1.0, and 97.2 and 2,497.3 nmol/L, resp., in KBM7-STI571R1.0 cells. AMN107 inhibited autophosphorylation of Bcr-Abl kinase more effectively than imatinib in all cell lines. They had similar effects on cell cycle progression and apoptotic response in these cell lines. Among severe combined immunodeficient mice bearing KBM5 cells, mean survival times of groups treated with 10, 20, and 30 mg/kg/d of AMN107, starting day 20 after leukemic cell grafting and continuing for 20 days, were 144%, 159%, and 182%, resp., compared with controls. These results strongly support investigation of the clin. efficacy of AMN107 in patients with CML.

AB Imatinib, a Bcr-Abl tyrosine kinase inhibitor, is a highly effective therapy for patients with chronic myelogenous leukemia (CML). Despite durable responses in most chronic phase patients, relapses have been observed and are much more prevalent in patients with advanced disease. The most common mechanism of acquired imatinib resistance has been traced to Bcr-Abl kinase domain mutations with decreased imatinib sensitivity. Thus, alternate Bcr-Abl kinase inhibitors that have activity against imatinib-resistant mutants would be useful for patients who relapse on imatinib therapy. Two such Bcr-Abl inhibitors are currently being evaluated in clin. trials: the improved potency, selective Abl inhibitor AMN107 and the highly potent dual Src/Abl inhibitor BMS-354825. In the current article, the authors compared imatinib, AMN107, and BMS-354825 in cellular and biochem. assays against a panel of 16 kinase domain mutants representing >90% of clin. isolates. The authors report that AMN107 and BMS-354825 are 20-fold and 325-fold more potent than imatinib against cells expressing wild-type Bcr-Abl and that similar improvements are maintained for all imatinib-resistant mutants tested, with the exception of T315I. Thus, both inhibitors hold promise for treating imatinib-refractory CML.

AB The invention relates to the use of an enzyme inhibitor of formula (I) or a N-Oxide or a pharmaceutically acceptable salt thereof [wherein R1 = H, lower alkyl, lower alkoxy-lower alkyl, acyloxy-lower alkyl, carboxy-lower alkyl, lower alkoxy-carbonyl-lower alkyl, phenyl-lower alkyl; R2 = H, each (un)substituted lower alkyl, cycloalkyl, benzocycloalkyl, heterocyclyl, aryl, or a mono- or bicyclic heteroaryl; or wherein R1 and R2 together represent (un)substituted C4-6 alkylene, C4-5 benzalkylene, oxaalkylene with one oxygen and three or four carbon atoms; or azaalkylene with one nitrogen and three or four carbon atoms wherein nitrogen is optionally substituted; R4 = H, lower alkyl, or halogen] having an activity on protein kinases VEGFR-2, Tie-2, c-Src, c-Met, FGFR-1, Flt-1, HER-2, c-Abl, c-Raf, PDGFR-beta, c-Kit, or on a combination of the above enzymes, for the treatment and/or prevention of neurol. and vascular neurol. disorders related to beta-amyloid generation and/or aggregation such as neurodegenerative diseases like Alzheimer's disease, Down's Syndrome, memory and cognitive impairment, dementia, amyloid neuropathies, brain inflammation, nerve and brain trauma, vascular amyloidosis, or cerebral hemorrhage with amyloidosis. Most preferred compound, 4-methyl-N-[3-(4-methylimidazol-1-yl)-5-trifluoromethylphenyl]-3-[[4-(pyridin-3-yl)pyrimidin-2-yl]amino]benzamide (II), exhibited the following inhibitor activities in cellfree enzyme assays on protein kinases: protein kinase 3.2, Tie-2 4.6, Src 4.6, c-Met 4.7, FGFR-1 6.7, Flt-1 7.7, HER-2 7.2 μ M, c-Abl 295 nM, c-Raf-1 1.1, PDGFR- β 5.8, and c-Kit 7.8 μ M. The compound I demonstrated a clear reduction of Abeta secretion in the medium of HEK/APPswe cell cultures at concns. below 10 μ M, without having any effect on cellular viability.

 AB The Bcr-Abl tyrosine kinase oncogene causes chronic myelogenous leukemia (CML) and Philadelphia chromosome-pos. (Ph+) acute lymphoblastic leukemia (ALL). We describe a novel selective inhibitor of Bcr-Abl, AMN107 (IC50 < 30 nM), which is significantly more potent than imatinib, and active against a number of imatinib-resistant Bcr-Abl mutants. Crystallog. anal. of Abl-AMN107 complexes provides a structural explanation for the differential activity of AMN107 and imatinib against imatinib-resistant Bcr-Abl. Consistent with its in vitro and pharmacokinetic profile, AMN107 prolonged survival of mice injected with Bcr-Abl-transformed hematopoietic cell lines or primary marrow cells, and prolonged survival in imatinib-resistant CML mouse models. AMN107 is a promising new inhibitor for the therapy of CML and Ph+ ALL.

 AB A review with refs. The Abl inhibitor imatinib is a highly effective therapy for patients with chronic myeloid leukemia. Relapses are relatively uncommon in newly diagnosed patients, but are the rule in patients with more advanced disease. Mutations in the BCR-ABL gene are the most common cause of relapse. Working from the imatinib chemical structure, a higher-affinity family member, AMN107, was designed. AMN107 is approx. 20-fold more potent than imatinib, and this translates into improved inhibitory activity against most of the common BCR-ABL mutations. The implications of these results, and the potential role this and other novel ABL inhibitors may have in treating patients with CML, are discussed.

OS MARPAT 141:308988

AB A method of controlling and preventing an infection of crop plants by phytopathogenic microorganisms comprises the application of the title compds. (I, wherein A and A' are both N, both CH, or A is CH and A' is N; j = 0, 1; R1 = (un)substituted hydrazino, cyclohexylamino, piperazinyl, etc.; R2 = H, halo, C1-C4 alkyl, etc.; R3 = H, halo, C1-C4 alkyl, OH, CN, etc.; R4, R5 and R6 = independently H, halo, (un)substituted alkyl, alkenyl, or thioalkyl, etc.). Thus, 5-wk-old grape seedlings cv. Gutedel were treated with formulated I, where A = CH, A' = N, n = 0, R1 = NHCH2CH2CH2OH, R2, R3, R5 and R6 = H, and R4 = NO2, at 0.02% active substance in a spray chamber. One day after application grape plants were inoculated with a sporangial suspension of Plasmopara viticola. After incubation for 6 days at 22° and 95% r. h. in a greenhouse, the control of the fungal infection was >70%.

OS MARPAT 141:243576

AB The invention provides a novel class of cyclic compds. I, wherein n is 0-3; R1 hydrogen and alkyl; R2-R3 are independently substituted arylene and hetero-arylene; R4 4 is -XIR6(CH2)mNR7C(O)-, -XNR6(CH2)mNR7C(O)CH2-, -XR6(CH2)mNR7(CH2)mNR7C(O)-, -O(CH2)mNR7C(O)-, -NR6(CH2)mO- and -XNR6(CH2)mNR7CH2-; wherein X is a bond or C-alkylene; m is 1-6; R6 and R7 independently are hydrogen and alkyl; and R5 is halo, alkyl, halo-substituted alkyl, alkoxy and halo-substituted alkoxy and heterocycloalkyl; wherein any heterocycloalkyl of R5 is substituted with a group halo, alkyl, halo-substituted alkyl, alkoxy, halo-substituted alkoxy, heterocycloalkyl-alkyl and -XNR8R9, wherein X is a bond or alkylene; R8 and R9 are independently hydrogen and alkyl; or a salt thereof pharmaceutical compns. comprising such cyclic compds. and methods of using such compds. to treat or prevent diseases and disorders associated with cyclin-dependent kinases (CDKs) activity, particularly diseases associated with the activity of CDK2 and CDK5. Thus, macrocycle II was prepared and tested as CDK2 and CDK5 inhibitors.

OS MARPAT 140:77161

AB Title compds. I [wherein R1 = H, alkoxy/carboxy/alkoxycarbonyl/phenyl/alkyl; R2 = H, (un)substituted cyclo/benzcyclo/alkyl, heterocyclyl, aryl, mono- or bicyclic heteroaryl; R1R2 = (un)substituted alkylene with 4-6 C atoms, benzalkylene with 4 or 5 C atoms, oxaalkylene with one O and 3 or 4 C atoms, azaalkylene with one N and 3 or 4 C atoms where N is (un)substituted by phenyl/alkoxycarbonyl/carboxy/carbamoyl/alkyl, alkoxycarbonyl, carboxy, (un)substituted Ph, pyridyl, pyrimidinyl, pyrazinyl, etc.; R4 = H, alkyl, halo; their N-oxides, tautomers, and pharmaceutical acceptable salts] were prepared as inhibitors of protein kinases, in particular tyrosine kinases for treating neoplastic diseases, especially leukemia. II was prepared by amidation of

4-Methyl-3-[[4-(3-pyridinyl)-

2-pyrimidinyl]amino]benzoic acid (preparation given) with N,N-diethyl-1,3-benzenediamine in the presence of propylphosphonic anhydride/TEA/DMF at room temperature for 24 h. In an in vitro test, II inhibited C-Abl, KDR, and Flt3 tyrosine kinase in 98%, 88%, and 41% resp. I exhibited IC50 values for the inhibition of Flt-1 VEGF receptor tyrosine kinase in the range of 1-10,000 nM, preferably in the range of 1-100 nM. Thus, I and their pharmaceutical compns. are useful for treatment of neoplasm, in particular leukemia.

 AB Due to its relatively clear etiol., chronic myelogenous leukemia (CML) represents an ideal disease target for a therapy using a selective inhibitor of the Bcr-Abl tyrosine protein kinase. Extensive optimization of the class of phenylamino-pyrimidines yielded highly potent and selective Bcr-Abl kinase inhibitors.

OS MARPAT 121:99786

AB Known N-phenyl-2-pyrimidinamine derivs. I [R1, R2 = H, C1-3 alkyl; R3 = (substituted) pyridyl, furyl, thienyl, phenothiazinyl, pyrrolyl, etc.; R4 = R1, C(O)CO2Et, Me2NCH2CH2; ≥1 of R5-R8 = alkyl, alkoxy, halo, OH, Ph, (substituted) amino, N-heterocyclyl, CO2H, etc.; remaining R5-R8 = H] which inhibit mammalian protein kinase C are useful as antitumor drugs. Thus, N-(3-trifluoromethylphenyl)-4-(3-pyridyl)-2-pyrimidinamine (II) (50 mg/day orally for 15 days) inhibited growth of s.c. implanted human bladder carcinoma by 54%. II inhibited pig brain protein kinase C by 50% at 2.5 μM in vitro. Tablets were prepared each containing I 20, corn starch 60, lactose 50, colloidal SiO2 5, talc 9, and Mg stearate 1 mg.
